

LOCKING SYSTEM MANAGEMENT SOFTWARE

Release Notes version 3.0 SP3 (3.0.10051)

July 2011

1.0 PRELIMINARY NOTES

This version is intended to fix a number of bugs in the software.

1.1. DESIGNATIONS USED

LSM LSM Basic Edition, LSM Business Edition, LSM Professional Edition
LSM Mobile PC LSM Mobile Edition PC for use on a netbook / laptop
LSM Mobile PDA LSM Mobile Edition PDA for use on an approved PDA

1.2. REQUIREMENTS

The relevant system requirements and compatibilities should be taken into account during operation.

2.0 BUGFIXES

2.1. EXPORTING G2 LOCKS TO A PDA

G2 locks situated in areas that were closed since the matrix was opened were not exported to the PDA. A complete export will now be effected.

2.2. EXPORTING G2 LOCKS WITH PROGRAMMING REQUIREMENT

For a G2pur locking system without programming requirement a new authorisation is set and the transponder is programmed (no programming requirement). The lock in question was exported by mistake when exporting to LSM Mobile Edition using the option "locks with programming requirement". The selection is now performed correctly.

2.3. READING ACCESS LISTS WITH LSM MOBILE EDITION

The access list for one lock only was imported. Access lists will now be imported for all locks.

2.4. DEACTIVATED LOCS

Locks in the reset status were assigned incorrect status bits (deactivated, flipflop on, emergency activation active, storage mode).
These bits will now be deleted and correctly set when initial programming is performed.

2.5. REPORTS

Various reports displaying authorisations computed the inherited group authorisation incorrectly (e.g. whenever inheritance was activated for areas, and not for transponders).

2.6. RICHT TO ACCESS LIST ADMINISTRATION

Rights were not applied completely. The AdminAL is now given the correct rights.
